

■ PLANETARY GEAR UNIT

1. Construction

- The counter drive and driven gears are placed in front of the front planetary gear and the under drive (U/D) planetary gear unit is placed above the counter shaft. Furthermore, the force transmission method has been changed by eliminating the brake and the one-way clutch. As a result, a torque capacity that accommodates the high output engine has been attained, while realizing a compact gear unit.
- A centrifugal fluid pressure canceling mechanism has been adopted in the C₂ and C₃ clutches that are applied when shifting from 2nd to 3rd and from 3rd to 4th.

2. Function of Component

Component		Function
C ₁	Forward Clutch	Connects input shaft and front planetary sun gear.
C ₂	Direct Clutch	Connects input shaft and rear planetary sun gear.
C ₃	U/D Direct Brake	Connects U/D sun gear and U/D planetary carrier.
B ₁	2nd Brake	Prevents rear planetary carrier from turning either clockwise or counterclockwise.
B ₂	1st & Reverse Brake	Prevents rear planetary carrier and front planetary ring gear from turning either clockwise or counterclockwise.
B ₃	U/D Brake	Prevents U/D sun gear from turning either clockwise or counterclockwise.
F ₁	No. 1 One-Way Clutch	Prevents rear planetary carrier from turning counterclockwise.
F ₂	U/D One-Way Clutch	Prevents U/D planetary sun gear from turning clockwise.
Planetary Gears		These gears change the route through which driving force is transmitted, in accordance with the operation of each clutch and brake, in order to increase or reduce the input and output speed.

3. Motive Power Transaxle

1st Gear (D or 2 Position)

2nd Gear (D or 2 Position)**3rd Gear (D Position)****4th Gear (D Position)**

The diagram illustrates a planetary gear set for a vehicle transmission. It features an input shaft connected to a counter drive gear, which meshes with a sun gear. This sun gear is part of a front planetary gear set, which includes a rear planetary gear and a counter drive gear. The front planetary gear set is connected to an intermediate shaft, which is also connected to a counter driven gear. The counter driven gear meshes with a sun gear, which is part of a U/D planetary gear set. The U/D planetary gear set is connected to a differential drive pinion, which meshes with a ring gear. The diagram also shows various clutches (C1, C2, C3) and brakes (B1, B2, B3) that can be engaged or disengaged to achieve different gear ratios. The input shaft is connected to the counter drive gear, and the output shaft is connected to the ring gear. The intermediate shaft is connected to the counter driven gear and the sun gear of the U/D planetary gear set. The differential drive pinion is connected to the ring gear, and the output shaft is connected to the differential drive pinion. The diagram shows the input shaft, intermediate shaft, and output shaft, along with the counter drive gear, counter driven gear, sun gear, rear planetary gear, front planetary gear, U/D planetary gear, differential drive pinion, and ring gear. It also shows clutches C1, C2, and C3, and brakes B1, B2, and B3. The input shaft is connected to the counter drive gear, and the output shaft is connected to the ring gear. The intermediate shaft is connected to the counter driven gear and the sun gear of the U/D planetary gear set. The differential drive pinion is connected to the ring gear, and the output shaft is connected to the differential drive pinion. The diagram shows the input shaft, intermediate shaft, and output shaft, along with the counter drive gear, counter driven gear, sun gear, rear planetary gear, front planetary gear, U/D planetary gear, differential drive pinion, and ring gear. It also shows clutches C1, C2, and C3, and brakes B1, B2, and B3.

4. Centrifugal Fluid Pressure Canceling Mechanism

There are two reasons for improving the conventional clutch mechanism:

- To prevent the generation of pressure by the centrifugal force that applied to the fluid in piston fluid pressure chamber (hereafter referred to as “chamber A”) when the clutch is released, a check ball is provided to discharge the fluid. Therefore, before the clutch can be subsequently applied, it took time for the fluid to fill the chamber A.
- During shifting, in addition to the original clutch pressure that is controlled by the valve body, the pressure that acts on the fluid in the chamber A also exerts influence, which is dependent upon revolution fluctuations.

To address these two needs for improvement, a canceling fluid pressure chamber (hereafter referred to as “chamber B”) has been provided opposite chamber A.

208CH05

By utilizing the lubrication fluid such as that of the shaft, the same amount of centrifugal force is applied, thus canceling the centrifugal force that is applied to the piston itself. Accordingly, it is not necessary to discharge the fluid through the use of a check ball, and a highly responsive and smooth shifting characteristic has been achieved.

157CH17

$$\text{Fluid pressure applied to piston} - \text{Centrifugal fluid pressure applied to chamber B} = \text{Target fluid pressure (original clutch pressure)}$$
